Groww for GenZ — Evals

9 October 2026 · **Apoorva Pandey**

Results

The final run passed 80 of 80 checks against the published prototype, a single 138 KB HTML file. The harness drives the real app through its UI in a headless DOM: it clicks buttons, types and moves sliders. Only browser APIs the headless DOM lacks (canvas, media queries) are stubbed.

Eval group	Checks	Passed	What it covers
Functional	37	37	Every flow end to end, plus plan maths on 6,804 generated plans
Guardrails	19	19	Calm view, pause friction, F&O license, no hype phrases, no rupees on Squad
Personas	4	4	Four scripted users investing ₹300 to ₹10,000 a month
Content	6	6	Lesson structure, readability, money-word coverage, Hinglish
Accessibility and integrity	14	14	Contrast, tap targets, headings, file size, network calls, simulation sanity
Total	**80**	**80**	

To re-run: download `run-evals.js`, then run `npm i jsdom && node run-evals.js groww-genz.html`. It prints PASS or FAIL per check and writes `eval-results.json`.

What the evals check, and why

Each eval exists to protect one product principle from the spec, so a failing check means a broken promise to the user, not just a bug.

Principle	What is checked	Measured result
Goals before numbers	Plan engine on every situation, income band, goal mix, vibe answer and amount	6,804 of 6,804 plans: SIPs sum exactly to the monthly amount, in ₹50 steps, each ₹100 or more
Range, not promise	Every projection shows a bad-luck case and "Illustrative, not guaranteed"	10 of 10 projections. Chance of loss falls from 24% at 1 year to 8% at 5 and 2.5% at 10
Calm by default	Daily moves hidden by default; a dip shows a calm card; pausing asks once, then works	All pass, including pause and resume on every SIP
Learn in the flow	Every money word used in the UI has a decoder entry with Hinglish; bytes read plainly	18 of 18 words. Bytes score 79 to 93 on Flesch reading ease; no sentence over 20 words
Guardrails, not walls	License steps unlock in order; quiz needs 3 of 4; apply locked until risk is acknowledged; 24-hour cool-off; F&O in no plan	All pass. Low-income students are warned but never blocked
Social without amounts	No rupee sign anywhere on Squad; board ranked by streak	Pass

Principle	What is checked	Measured result
Quality floor	Contrast, tap targets, labels, headings, escaping, network, size	115 colour pairs at 4.5:1 or better; 20 tap-target kinds at 44 px or more; no calls except Google Fonts; no console errors across 135 crawled screens

Persona walkthroughs

All four scripted users got a plan that fits their money and temperament. Each one was onboarded through the real UI, and the harness asserted what they should see.

Persona	Inputs	What the app did	Result
Riya, 20, student	₹300 a month; trip and Future me; would sell in a dip	Trip in a liquid fund. Future me softened to Balanced, with a note saying why. The trip date shown honestly as "at this pace", years out	Pass
Arjun, 24, first job	₹10,000 a month; emergency fund, laptop, Future me	Emergency target ₹40,000, one month of expenses. Emergency gets first claim (₹4,250 vs ₹3,750 for the laptop). Future me in a Nifty 50 index fund. No F&O anywhere	Pass
Sana, 25, freelancer	₹3,500 a month; higher studies and Future me	Studies in a balanced fund, SIPs summing to exactly ₹3,500. Home shows two skip passes for lean months and offers round-ups	Pass
Kabir, 21, student	₹500 a month; just exploring	One small Future me goal and a 60-second byte on Home. The F&O license shows a "we'd suggest waiting" note but stays open	Pass

What the evals caught

Three problems surfaced during the build, and each was fixed at its root cause. The first harness run passed 79 of 80, and the second passed 80 of 80.

What failed	Found by	Root cause	Fix
Mobile Demo button covered the bottom buttons and the streak dots; desktop phone bezel clipped on short screens	Real Chromium screenshots of 12 screens	Floating button pinned to the bottom; phone height ignored the bezel	Button moved top-right on phones; phone capped at screen height minus 30 px. Evals re-run: 80 of 80
Tap-target check read the main button as 0 px tall	Eval harness, run 1	Harness bug: a CSS comment sat in front of the selector. The real height is 52 px	Parser strips comments. The app was unchanged
Coral warning text on its pink tint measured 4.36:1, below 4.5:1	Contrast check on the spec palette	Spec colour #C93434 too light for small text	Shipped #B42D2D, which measures 5.24:1

Human evaluation plan (to run)

Automated checks prove the app does what the spec says. Only real users can show whether the spec is right, so this test still needs to happen with five people aged 20 to 26. Use two students, two first-jobbers and one freelancer, each on their own phone. Give no help and record the time per task.

Task	Pass threshold	P1	P2	P3	P4	P5
Set up a plan for a trip and Future me	Done unaided in under 3 minutes					
"Where does your trip money go, and why?"	Says a safe or liquid fund, because it's needed soon					
Read the futures chart: worst case, and how likely?	Names the bad-luck amount and the chance of loss					
The market falls 4.1%. What do you do?	Records the choice; target is 4 of 5 keep their SIP					
Find out what NAV means	Opens the decoder in under 30 seconds					
Try to unlock F&O	Rates the license as fair, 4 or more out of 5					
Paste a tip from your own WhatsApp or Telegram	Reads the risk level correctly					

After each task, ask "How easy was that?" on a 1 to 7 scale; the target average is 5.5. Close with two questions: "Would you trust this with your first ₹1,000?" and "What would make you stop using it?"

After launch: metrics and known limits

The north-star metric is the share of new 20 to 26 year-old users with an active SIP six months after their first investment. Six-month retention measures "start and stay" directly, which trading volume never does.

Type	Metric	Direction
North star	Active SIP at month 6, new 20 to 26 year-olds	Up
Input	First investment within 7 days of signing up	Up
Input	Payday prompts accepted	Up
Input	SIP pause rate in dip weeks vs normal weeks	Gap shrinks
Input	Bytes finished per new user in the first month	Up
Guardrail	F&O activations by under-25s without a completed license	Zero
Guardrail	Redemptions within 30 days of a first investment	Down
Guardrail	Complaints per 10,000 users	Flat or down

Known limits of this prototype:

- Funds, NAVs and returns are invented; fund houses are fictional.
- The simulation uses steady volatility, so it understates crash risk. "Bad luck" is a 1-in-10 case, not the worst case.
- Tip Check is rule-based and can miss new scam wording.
- There is no real KYC, payment, market data or back end.
- Automated evals run in a headless DOM with no layout engine. Visual checks came from a separate Chromium screenshot pass.

- The human evaluation above has not been run yet.
